                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses
                                                                                                                                                                                                                                                                                                                29-JAN-2001
                                                                                                                                                                                                                                                                                                                                                  AAB33428;

Sixty four PRO polypeptides, useful in the diagnosis and treatment immune related disorders, e.g. systemic lupus erythematosis, rheumarthritis, osteoarthritis, thyroiditis and diabetes mellitus. atment of rheumatoid

Claim 33; Fig 30; 309pp; English.

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases ō, central and

The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from

                  This invention relates to 59 human secreted proteins and the nucleotide sequences encoding them. Sequences AAC59788-C59846 and AAB34687-B34745 represent the proteins and their encoding nucleotide sequences, and sequences AAB34746-B34771 represent fragments of the proteins. Probes for the DNA sequences are represented by sequences AAC59847-C59596. The proteins exhibit neuroprotective, dermatological, immunosuppressive, antiinflammatory, antianaemic, nootropic, antiparkinsonian,
                                                                                                                                                                                                                                                                                  Novel proteins and polypeptides useful for the treatment of e.g multiple sclerosis, systemic lupus erythmatosus, rheumatoid arthritis, cancer, Alzheimer's disease, Parkinson's disease, stroke, anemia and ulcers.
                                                                                                                                                                                                                                       Claim 114; Page

complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotide; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the coligonucleotide comprises a 1'-end sequence, where the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH13628 and CDNAs easily without any specialised methods. AAH03166 to AAH13628 and represent human amino acid sequences; and AAH13639 to AAH13632 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44289 and AAB55194 to AAF65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention

GENENTECH

N-PSDB;

New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes.

Claim 12; Fig 32; 178pp; English.

The invention relates to an isolated PRO polypeptide (a secreted or CC transmembrane protein) comprising: (a) at least 80% sequence identity or CC positives when compared to any of 15 sequences, fully defined in the CC specification, lacking or with its associated signal peptide; or (b) at CC coding sequence of a DNA deposited in the American Type Culture CC coding sequence of a DNA deposited in the American Type Culture CC coding sequence of a DNA deposited in the American Type Culture CC coding sequence of a DNA deposited in the American Type Culture CC coding sequence or full-length coding sequence identity to a nucleotide sequence (C that encodes a PRO protein; (b) at least 80% sequence with any of 15 fully CC defined sequences of 957-3441 base pairs, given in the specification; or CC (c) at least 80% sequence identity to a full-length coding sequence of a CC DNA deposited under ATCC Accession No. 209526, 209527, 209528, CC 209530, 209523, 209422, 209532, 209531, 209529, 209570, 209518, CC 209530, 209523, 209422, 209532, 209531, 209529, 209570, 209518, CC 209530, 209531, 209523, 209531, 209527, 209540, a host CC cell comprising the vector comprising the nucleic acid; (3) a host CC comprising the vector which, when cultured under conditions suitable CC comprising the PRO polypeptide, produces the PRO protein; (4) a CC chimeric molecule comprising PRO fused to a heterologous amino acid compositions of cd disorders associated with the PRO polypeptide, such as AIDS (acmired CC disorders associated with the PRO polypeptide, such as AIDS (acmired disorders associated with the PRO polypeptide, such as AIDS (acquired immunodeficiency syndrome), cancer, atherosclerosis, inflammatory disease, diabetic complications, cardiac injury and organ failure. Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer

Claim 12; Fig 648pp; English.

The invention describes an isolated human PRO polypeptide. The PRO CC polypeptides are useful in detecting PRO polypeptides in a sample, in CC linking a bioactive molecule to a cell expressing a PRO polypeptide, and CC in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of meonatal heart and is thus CC useful for treating cardiac insufficiency disorders. PRO154 and PRO1186 CC stimulate advantal capillary endothelial growth, and PRO5136, CC PRO943, PRO828, PRO926, PRO1068 or PRO535, PRO826, PRO819, PRO8128, PRO826, PRO1068 or PRO535, PRO819, PRO81126, CC PRO943, PRO828, PRO926, PRO1068 or PRO535, PRO819, PRO81126, CC PRO943, PRO828, PRO926, PRO1068 or PRO535, PRO819, PRO81126, CC Useful for treating conditions or disorders where anglogenesis would be beneficial, e.g. wound healing and ancagonist of this polypeptide are CC useful for treating cancerous tumours. PRO812 inhibits vascular CC useful for treating cancerous tumours. PRO812 inhibits vascular CC cells and is thus useful for inhibiting endothelial cell growth in CC mammals which would be beneficial in inhibiting tumour growth. PRO826,

PRO828, PRO826, PRO132 enhance survival of retinal neurons cells (PRO132 is also enhances survival/proliferation of rod photoreceptor cells) and therefore are useful for treating retinal and PRO1066 induce proliferation of mammalian kidney mesangial cells, and therefore are useful for treating retinal and therefore are useful for treating kidney mesangial cells, and therefore are useful for treating kidney disorders associated with decreased mesangial cell function such as Berger disease or other nephropathies associated with dermatitis, herpetiformis or Crohn's disease. PRO1310, PRO844, PRO1312, PRO1192 and PRO1387 induce the proliferation and/or redifferentiation of chondrocytes in culture and are thus useful for treating sports injuries, and arthritis. This is the

New transmembrane polypeptides and nuo polypeptides, useful in gene therapy, chromosome markers, or in generating p nucleic acids encoding the py, in chromosome identification, probes

Claim 12; Fig 328; 650pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polypureleotides are also useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for

The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides are useful for detecting other PRO polypeptides, for linking CC biological activities of cells expressing PRO polypeptides, and for for cc dentifying agonists or antagonists. The polynucleotide sequences cc encoding PRO polypeptides, and for for CC chromosome and gene mapping, in the generation probes, in CC chromosome and gene mapping, in the generation probes for mapping the green which encodes the PRO polypeptides, for generating transgenic animals of individuals with genetic disorders, in gene therapy, for chromosome cc identification, as chromosome markers, and for generating probes for PCR, CC Northern analysis, Southern analysis and Western analysis. ABU13860-CC ABU14006 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 431 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS) and diabetic complications in mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits. The sequences are also useful in biotechnological and medical research and in various industrial applications. Sequences ABU60230-ABU60245 represent human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a human secreted and transmembrane polypeptide (PRO) and the polymucleotide encoding it. The PRO polypeptide or polymucleotide is useful in pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atheroscierosis, cardiac injury,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (GETH )

The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American Type Culture Collection (e.g. ATCC Deposit No. 209621, 552-PTA, 819-PTA, 209439, 203135, etc); or a sequence with at least 80% identity to a DNA encoding a PRO polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating e.g. malignancies or cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma,
                                                                                                                                                                                                                                                                                         Ashkenazi

The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide

New transmembrane polypeptides and polynucleotides useful for chromosome identification, tissue typing, gene therapy, in chromosome and gene or as molecular weight markers.

Claim 12; Fig 32; 172pp; English.

The invention relates to an isolated nucleic acid encoding a secreted/
CC transmembrane polypeptide (designated as PRO proteins). 15 PRO
CC polypeptides and their encoding polynucleotides are disclosed. Also
CC included are a vector comprising the PRO nucleic acid, a host cell
CC comprising the vector, a process for producing a PRO polypeptide (by
CC culturing the host cell under conditions for the expression of the PRO
CC polypeptide, and recovering the PRO polypeptide from the cell culture, an
CC isolated polypeptide having at least 80% amino acid sequence identity to
CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a
CC the PRO polypeptides, a chimaeric molecule sequence and an antibody which specifically binds
CC in chromosome and gene mapping, in generating sense and antisense RNA or
CC pNA, in generating transgenic or knock-out animals which can be used in
CC gene therapy. The polypeptides may be used as molecular weight markers
CC for protein electrophoresis purposes. The PRO polypeptides and nucleic
CC acids may also be used for chromosome identification, and tissue typing.
CC conditions are available to the proper consolidate gene for cornella de Lange
CC cornella de Lange syndrome. Other PRO proteins are variously implicated in immune disorders, inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, cardiac injury,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
